SYNTHETIC RECORD. NOT A REAL PERSON. NOT FOR CLINICAL USE.

MRI Brain Report

Riverside University Hospital, Department of Radiology

Patient name:	Maya Ortiz
MRN:	SYN-004127
Date of birth:	2004-03-22 (age 22)
Sex:	Female
Document date:	2026-10-11
Examination:	MRI brain, trauma protocol
Clinical indication:	Sport-related concussion day 3, CT negative, persisting symptoms

TECHNIQUE

3T. Sagittal 3D T1 MPRAGE, axial T2, axial FLAIR, axial DWI with ADC, axial susceptibility weighted imaging (SWI), coronal T2. No contrast.

FINDINGS

There is a small cortical contusion in the right frontal lobe, in the inferior frontal gyrus, measuring 9 x 6 mm, with mild surrounding T2 and FLAIR hyperintensity consistent with oedema. No restricted diffusion.

SWI demonstrates 2 small foci of susceptibility in the right frontal subcortical white matter, measuring 2 mm and 3 mm, consistent with traumatic microhaemorrhage. No foci elsewhere, in particular none at the grey-white junction of the temporal lobes or in the brainstem.

No extra-axial collection. No mass effect. Corpus callosum is intact and normal in signal. No hydrocephalus. Vascular flow voids are preserved in the dural venous sinuses.

IMPRESSION

Small right frontal cortical contusion measuring 9 x 6 mm with mild surrounding oedema. Two small foci of susceptibility in the right frontal white matter on SWI, consistent with microhaemorrhage. No extra-axial collection.
